Lab – Disassemble a Computer

Remove the Hard Drive.

a. Locate the hard drive. Carefully disconnect the power and data cables from the back of the hard drive.

Which type of data cable did you disconnect?

> Sata Data Cable

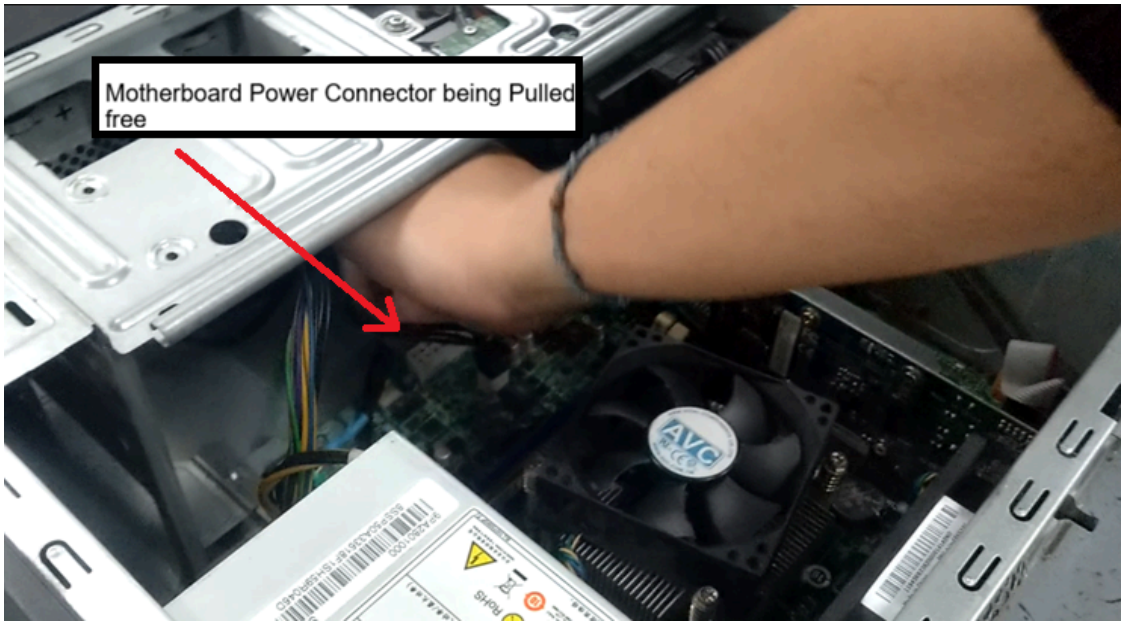

Remove the Power Supply.

a. Locate the power supply. Find the power connection(s) to the motherboard.

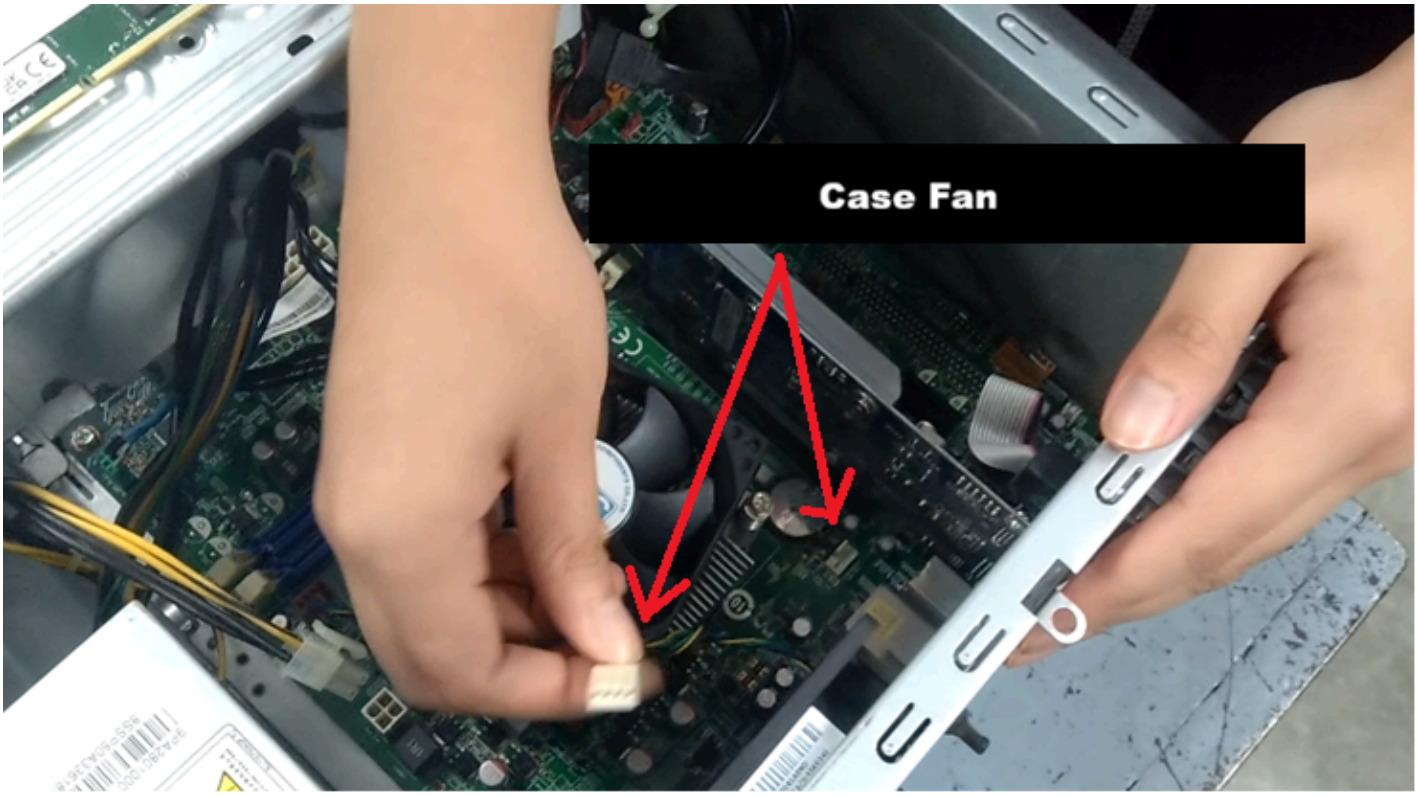

b. Gently remove the power connection(s) from the motherboard.

How many pins are there in the motherboard connector?

> 12 pins (2 x 6)

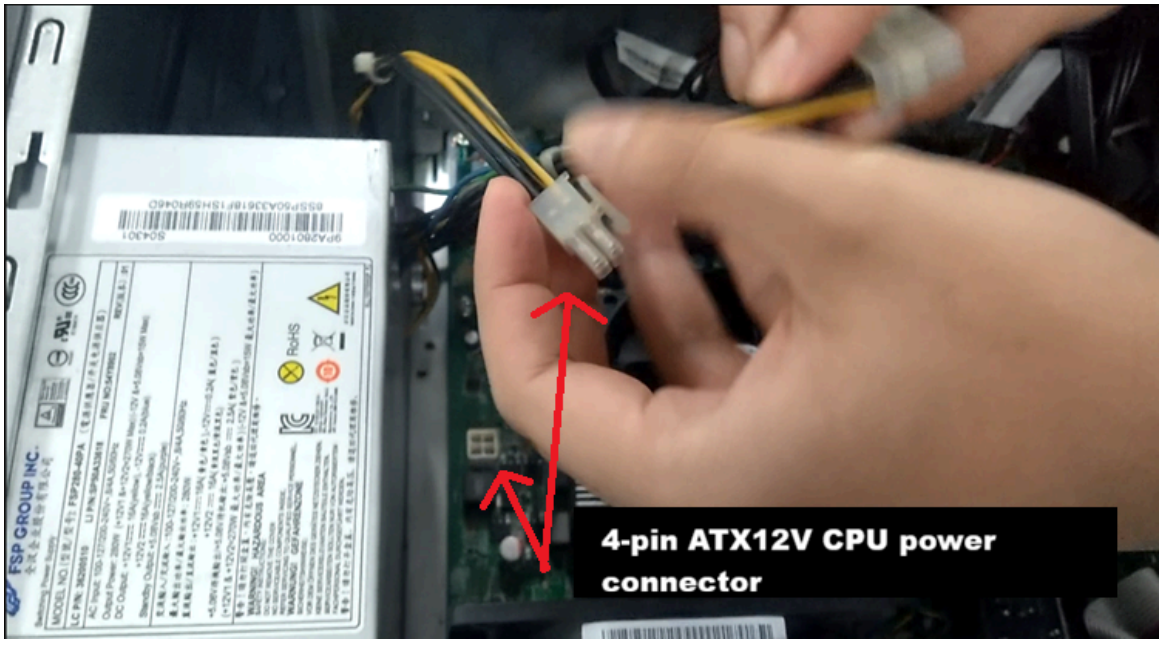

c. Disconnect the power cables from any case fans.

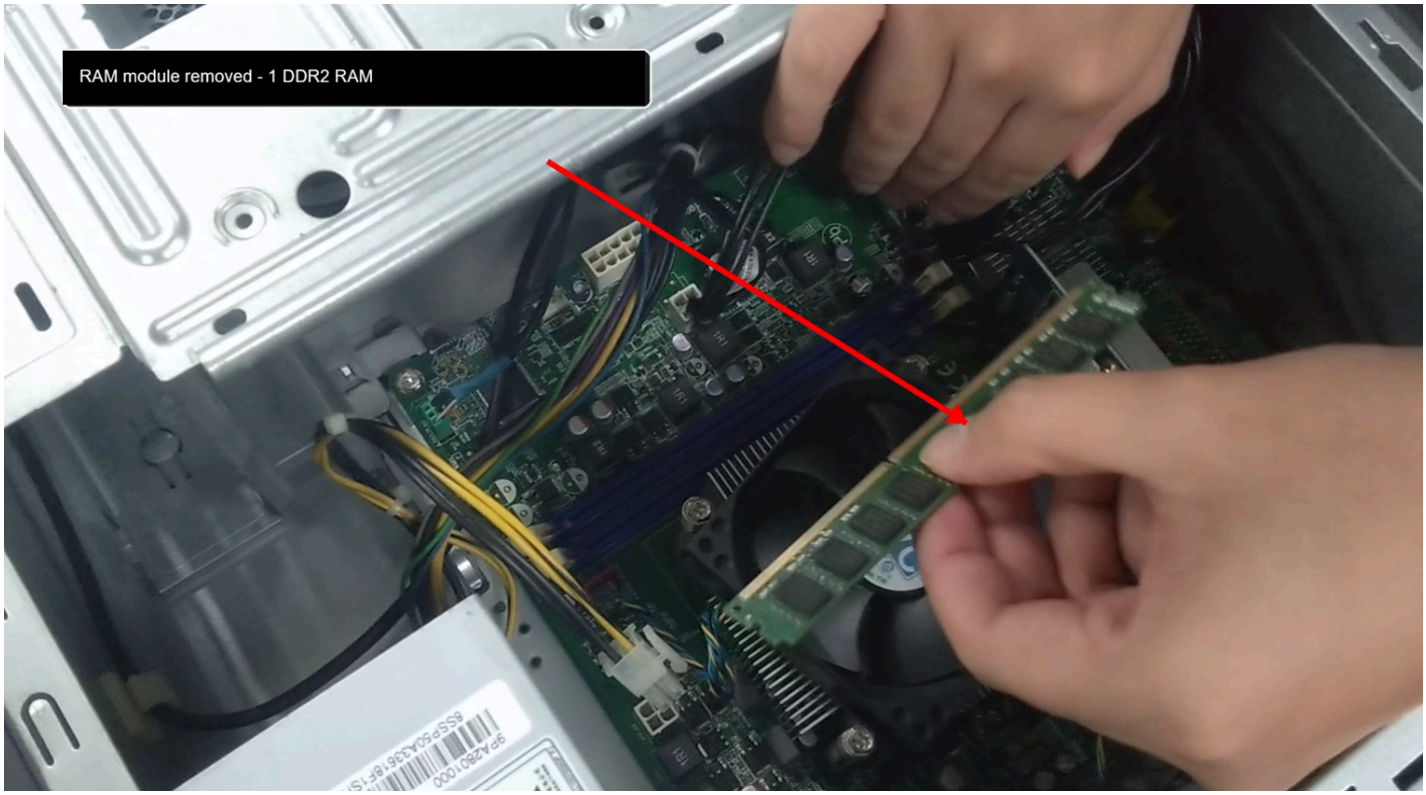

e. Disconnect any other power supply cables from where they were connected.

If there were additional cables disconnected, to what were they connected?
> Motherboard and storage/peripheral device power connections

Remove Memory Modules.

a. Locate the memory modules on the motherboard.

What type of memory modules are installed on the motherboard?
> 1 DDR2 RAM

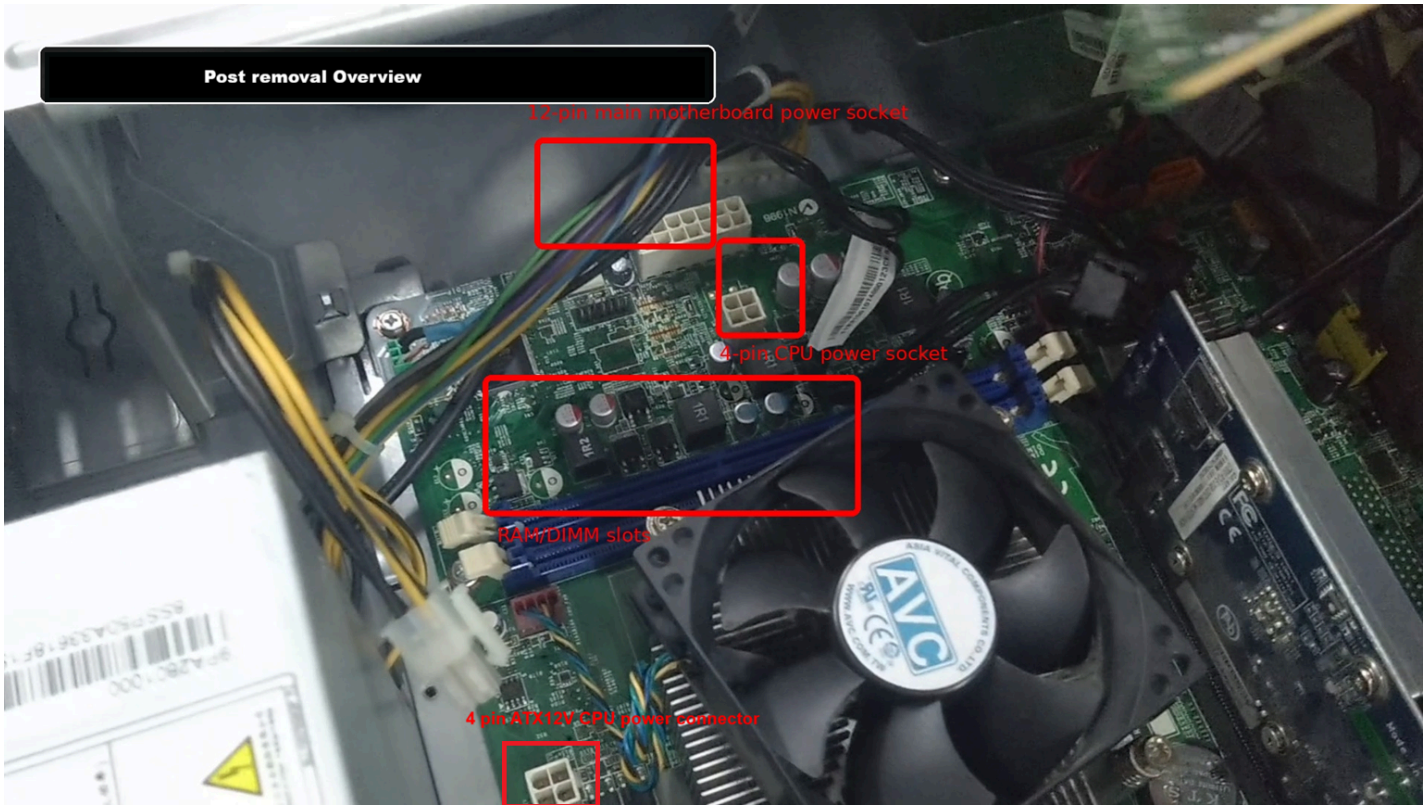

How many memory modules are installed on the motherboard?
> There is only 1 Memory Module

b. Remove the memory modules from the motherboard. Be sure to release any locking tabs that may be securing the memory module. Hold the memory module by the edges and gently lift out of the slot

Remove Data Cables.

a. Remove all data cables from the motherboard. Make sure to note the connection location of any cable you disconnect.

What types of cables were disconnected?
> SATA cables, Power Supply Cables, Fan Cable

Lab - Install the Motherboard in a Computer

Install the RAM.

a. Locate the RAM slots on the motherboard.

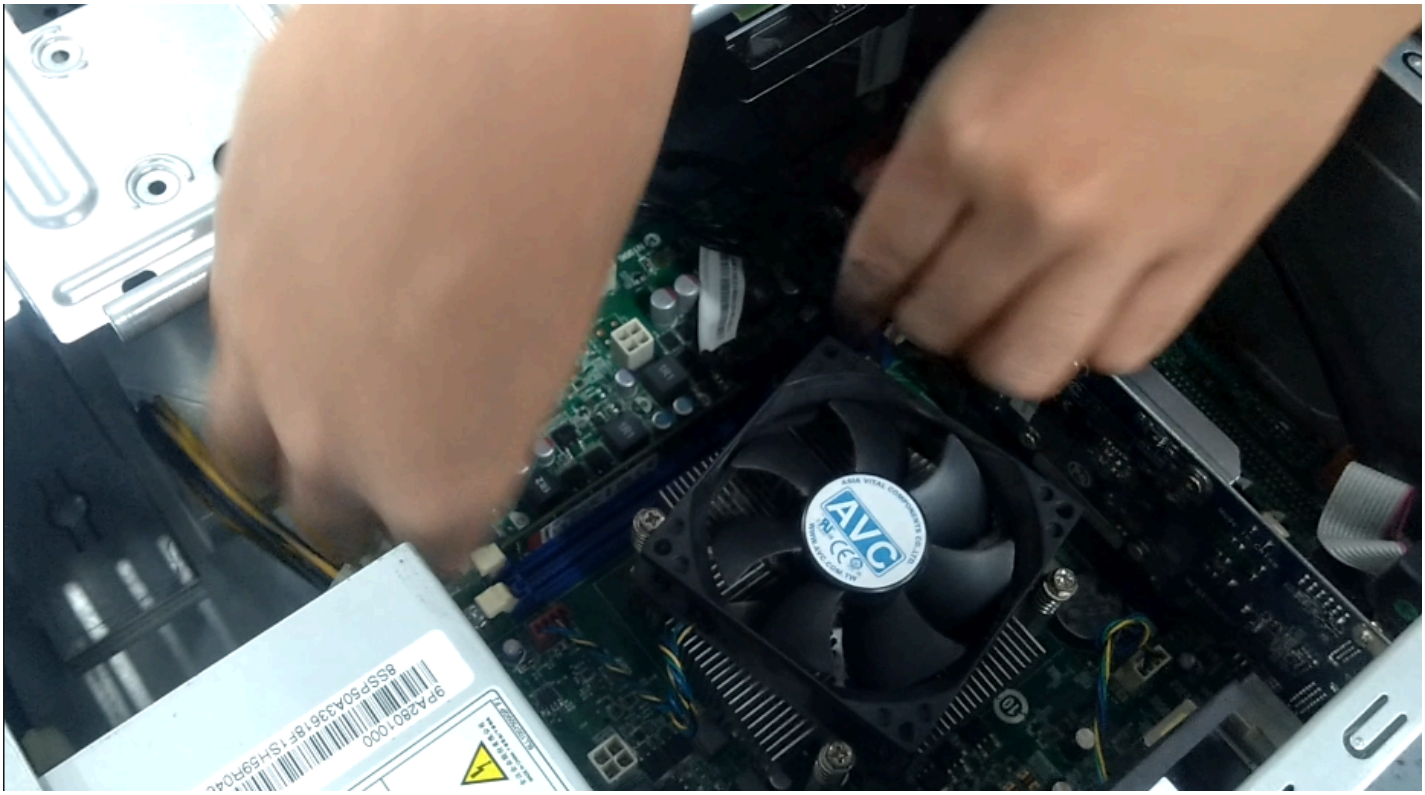

Questions:

In what type of slot(s) will the RAM module(s) be installed?

> DDR2 DIMM slot

How many notches are found on the bottom edge of the RAM module?

> 1 notch

Lab - Install the Drives

Install the Hard Disk Drive.

a. Only installed it via cable

Networking Academy

Lab - Complete the Computer Assembly

Attach the side panels.

a. Attach the side panels to the computer case.

During this activity, I learned how important it is to handle computer components carefully and install them correctly. I was able to understand the proper placement of parts such as the CPU, heat sink and fan, and DDR2 RAM on the motherboard. I also learned that components like RAM must be aligned properly with the slot before applying pressure, because forcing them can cause damage.

The activity helped me become more familiar with the internal parts of a computer and their functions. It also taught me to be patient, careful, and observant when working with hardware. Overall, this hands-on activity gave me more confidence in identifying and installing basic computer components correctly.
